

**ELORA BOUTIQUE : Pakistani
Readymade Dresses**

By

Shaikh Anam : AF05303920

ABSTRACT

Fashion and clothing have become an important part of modern lifestyle, especially with the growing popularity of online shopping. Many customers prefer to explore different designs, fabrics, and styles online before making a purchase. However, traditional boutique shopping requires customers to visit the store physically, and small boutiques may not have an organized online platform to display their collections.

Elora Boutique : Pakistani Readymade Dresses addresses this problem by providing a simple and user-friendly online boutique website where customers can explore Pakistani women's readymade dresses from the comfort of their homes. The website presents a curated collection of lawn suits, embroidered dresses, chiffon outfits, silk suits, organza dresses, and festive wear.

The platform provides different sections such as Home, Shop, New Arrivals, Collections, About Us, Login, and Cart, allowing users to easily navigate through the website and explore available products. Product information such as dress name, description, price, category, stock availability, and product images is displayed in an organized manner. The system also provides product filtering and category-based browsing to make product discovery easier.

The website is developed using HTML, CSS, and JavaScript for the frontend, with ASP.NET Core Web API used for backend functionality and Microsoft SQL Server used for storing product and user information. The system follows a simple client-server architecture that allows the website to retrieve product information from the database through APIs.

Elora Boutique aims to provide a visually appealing, organized, and convenient digital platform for showcasing Pakistani fashion collections while providing customers with an easy online shopping experience.

Keywords: Elora Boutique, Pakistani Dresses, Online Boutique, Readymade Dresses, E-Commerce, HTML, CSS, JavaScript, ASP.NET Core, SQL Server.

ACKNOWLEDGEMENT

The project “**ELORA BOUTIQUE : Pakistani Readymade Dresses**” is the project work carried out by

Name: Anam Shaikh

Enrollment No.: AF05303920

Under the Guidance of: Rajshri Thete

We are thankful to our project guide for guiding us to complete this project. Her suggestions and valuable information regarding the formation of the project report have provided us with a lot of help in completing the project and its related topics.

We are also thankful to our family members and friends who were always there to provide support, encouragement, and moral support throughout the development of this project.

We are grateful to everyone who directly or indirectly helped us in completing the **ELORA BOUTIQUE : Pakistani Readymade Dresses** project successfully.

Chapter 1

INTRODUCTION

Fashion and clothing have become an important part of modern lifestyle. With the growth of online shopping, customers increasingly prefer to explore different clothing styles, designs, fabrics, and prices before visiting a physical store. Traditional boutique shopping requires customers to visit the store personally, while small boutiques may not have an organized digital platform to showcase their products.

Elora Boutique is a Pakistani readymade dress boutique website designed to provide customers with a simple and convenient way to explore fashionable Pakistani outfits online. The website focuses on presenting products in an organized and attractive manner, allowing users to browse different collections, view product details, and explore new arrivals.

Unlike a traditional boutique where customers can only see products physically, Elora Boutique provides a digital product catalogue containing product images, names, descriptions, prices, categories, and stock information. The website also includes sections such as **Home, Shop, New Arrivals, Collections, About Us, Login, and Cart**, making it easier for users to navigate through the boutique.

The Role of Technology in Online Fashion

The development of web technologies has transformed the way fashion products are presented and accessed. Modern websites allow boutiques to display their collections online and provide customers with product information without requiring them to visit the physical store.

Elora Boutique uses **HTML, CSS, and JavaScript** to create an attractive and responsive frontend interface. **ASP.NET Core Web API** is used to provide backend functionality, while **Microsoft SQL Server** is used to store product and user-related information.

1.1 Background

In the contemporary fashion industry, online shopping has become an important method for discovering and purchasing clothing. Customers often look for different designs, fabrics, colors, and styles before deciding which outfit they want to purchase. Pakistani fashion is particularly known for its variety of lawn suits, embroidered dresses, chiffon outfits, silk suits, organza dresses, and festive wear.

Traditional boutiques generally depend on physical stores to display their collections. Customers need to visit the store to check available designs and obtain information about products. This can be inconvenient for customers who have limited time or prefer to browse products online.

Another challenge is that small boutiques may not have a dedicated website where their complete collection can be displayed in an organized way. Product information may be difficult to manage when there is no centralized system for storing details such as product name, price, category, stock, description, and images.

Elora Boutique is developed to provide a digital solution for these requirements. The website creates an online platform where Pakistani readymade dresses can be presented in different sections and categories. Users can browse products through the **Shop, New Arrivals, and Collections** sections and view important information about each product.

The system uses a database-driven approach in which product information is stored in **Microsoft SQL Server**. The **ASP.NET Core Web API** connects the frontend with the database and allows product information to be retrieved by the website. This provides a structured way of managing and displaying boutique products.

The website also includes a user login system and shopping-related features such as a cart. These features provide the foundation for developing the boutique into a more complete online shopping platform in the future.

1.2 Objectives

The primary objective of **Elora Boutique** is to provide a simple, attractive, and user-friendly online platform for showcasing Pakistani readymade dresses.

The main objectives of the project include:

- **Create an Online Boutique:** Develop a digital platform where Pakistani readymade dresses can be displayed and explored online.
- **Display Product Information:** Provide important product details such as product name, description, price, image, category, and stock availability.
- **cShowcase New Arrivals:** Provide a dedicated section for displaying newly added dresses and designs.
- **Organize Collections:** Arrange selected products into collections so users can browse different styles easily.
- **Provide Easy Navigation:** Create simple navigation through sections such as Home, Shop, New Arrivals, Collections, About Us, Login, and Cart.
- **Provide Product Browsing:** Allow users to browse the available products through an organized product listing.
- **Implement Database Management:** Store product and user information in Microsoft SQL Server for structured data management.
- **Connect Frontend and Backend:** Use ASP.NET Core Web API to connect the website interface with the database.
- **Provide User Login:** Allow users to access the website through a login system connected to the backend.
- **Improve Shopping Experience:** Provide features such as product viewing and cart functionality to create a convenient online shopping experience.

1.3 Purpose, Scope, and Applicability

1.3.1 Purpose

The primary purpose of the **Elora Boutique** project is to provide an easy-to-use online platform for showcasing and exploring Pakistani readymade dresses. Traditional boutique shopping requires customers to visit the physical store to view available designs and collect product information. Elora Boutique provides a digital alternative where customers can browse dresses, view product details, explore collections, and access new arrivals from one platform.

The website aims to provide an attractive and organized shopping experience by displaying product images, names, descriptions, prices, categories, and stock information. It also provides features such as user login and cart functionality, creating a basic foundation for an online fashion store.

1.3.2 Scope

The scope of **Elora Boutique** includes the development of an online Pakistani dress boutique with organized product browsing, product information, collections, and basic shopping functionality.

The major areas covered by the project are:

Product Catalogue and Browsing:

Users can browse Pakistani readymade dresses through the Shop section. Products contain details such as name, description, price, image, category, stock, and collection information.

New Arrivals:

The website provides a dedicated New Arrivals section where users can view newly added Pakistani dresses and discover the latest designs available in the boutique.

1.3.3 Applicability

Elora Boutique is applicable in the field of online fashion and e-commerce, particularly for boutiques that want to present their Pakistani readymade dress collections through a digital platform.

The website can be used in various contexts, including:

- **Online Product Showcase:** Customers can view Pakistani dresses and explore the available boutique collection online.
- **Fashion Product Browsing:** Users can browse different designs, fabrics, categories, and collections without visiting the physical store.
- **New Collection Promotion:** New arrivals and selected collections can be displayed separately to highlight different products.
- **Product Information Management:** Product details such as prices, descriptions, images, categories, and stock can be stored and managed through the database.
- **Customer Shopping:** The cart and product browsing features provide the basic structure for an online shopping experience.
- **Boutique Digital Presence:** Small and local boutiques can use a similar system to establish an online presence and showcase their products to a wider audience.
- **Future E-Commerce Expansion:** The website can be extended in the future with features such as online payment, order management, product reviews, customer profiles, delivery tracking, and an administrative dashboard.

1.4 Achievements

The development and implementation of **Elora Boutique** resulted in several key achievements that demonstrate the functionality of the website as an online Pakistani dress boutique.

Organized**Product****Display:**

The website successfully provides an organized product catalogue where Pakistani readymade dresses are displayed with their images, names, descriptions, prices, categories, and stock information.

New**Arrivals****and****Collections:**

Separate sections for **New Arrivals** and **Collections** were implemented to help users discover different groups of products easily.

Database**Integration:**

The website successfully connects with **Microsoft SQL Server** to store and retrieve product and user information. This provides a structured approach to managing boutique data.

Frontend**and****Backend****Integration:**

The integration of the HTML, CSS, and JavaScript frontend with the **ASP.NET Core Web API** allows product information to be retrieved dynamically from the database.

Improved**User****Navigation:**

The website provides clear navigation through sections such as Home, Shop, New Arrivals, Collections, About Us, Login, and Cart, making it easier for users to explore the boutique.

Product**Image****Integration:**

The project successfully integrates product images with the database-driven product catalogue, allowing users to visually explore the available dresses.

CHAPTER 2

SURVEY OF TECHNOLOGIES

2.1 Technical Review of ELORA BOUTIQUE

In today's digital environment, online shopping has become an important part of the retail industry. Customers increasingly prefer websites that allow them to explore products, view product details, check prices, and select products conveniently from their homes. Fashion and clothing businesses can benefit from online platforms because they can present their collections to a wider range of customers in an organized manner.

ELORA BOUTIQUE is a web-based Pakistani readymade dress boutique developed to provide a simple and user-friendly online shopping experience. The website focuses on Pakistani dresses such as lawn suits, embroidered suits, kurtas, casual wear, festive wear, formal wear, and other ready-made collections. The frontend of the system is developed using HTML5, CSS3, and JavaScript, while the backend is developed using ASP.NET Core 8 and C#. Microsoft SQL Server is used as the database, and Entity Framework Core is used for database communication. The combination of these technologies provides a structured platform for displaying and managing boutique products and related information.

2.2 Existing System

In a traditional boutique system, customers generally need to visit the physical store to view the available dresses and obtain information about products, prices, sizes, colors, and designs. Product information may be maintained manually, which can make product management time-consuming and difficult to organize. Some small boutiques also use social media platforms or messaging applications to display their products, but these platforms may not provide dedicated features for organized product browsing, categories, wishlist management, cart management, and order processing.

Customers may also face difficulties in finding a particular type of dress or checking the availability of products. Therefore, a dedicated online boutique website can

provide a more organized method for displaying products and managing customer interactions.

2.3 Proposed System

The proposed **ELORA BOUTIQUE** system is a web-based boutique platform designed to provide customers with a convenient and organized way to explore Pakistani ready-made dresses. The website provides different sections for displaying new arrivals, collections, categories, featured products, and product details. Customers can browse products and interact with available shopping features such as wishlist and shopping cart.

The frontend is developed using HTML5, CSS3, and JavaScript to provide an attractive and interactive user interface. The backend is developed using ASP.NET Core 8 and C#, which handles application logic and communication with the database. Microsoft SQL Server is used to store information related to products, categories, customers, and other required data. The proposed system provides a structured platform that can reduce manual product management and improve the overall online shopping experience.

2.3.1 User Interaction and Data Processing

The ELORA BOUTIQUE website provides an interactive interface through which users can browse products and perform different actions. When a user selects a product or performs an action such as adding a product to the cart or wishlist, the request can be processed by the application backend. The ASP.NET Core 8 backend handles the request and communicates with the SQL Server database when data needs to be retrieved or stored. The requested information is then returned to the frontend and displayed to the user. HTML, CSS, and JavaScript are responsible for presenting the information and providing user interaction, while ASP.NET Core handles the application logic and Entity Framework Core helps in communicating with the database. This separation makes the application organized and easier to maintain.

2.3.2 Future Enhancement and Smart Features

The current ELORA BOUTIQUE system can be enhanced in the future by adding additional features to improve the shopping experience. These features may include online payment gateway integration, product reviews and ratings, advanced product search, size and color selection, discount and coupon management, order tracking, email notifications, and personalized product recommendations. The system can also be enhanced with improved stock management and customer feedback functionality. Such features can help make the website more useful for both customers and boutique administrators while providing a more complete online shopping experience.

2.3.3 Cloud and Backend Architecture

The backend of ELORA BOUTIQUE is developed using ASP.NET Core 8, which is a modern framework used for developing web applications and web APIs. The backend is responsible for handling application operations and communication between the frontend and database. It can process requests related to products, categories, users, cart information, wishlist information, and orders. The frontend communicates with the ASP.NET Core backend through APIs, and the backend communicates with Microsoft SQL Server through Entity Framework Core. This architecture separates the presentation, application, and database layers. Such separation helps in organizing the application and makes it easier to maintain, test, and extend in the future.

2.4 Frontend Technologies

The frontend is the visible part of a website with which users directly interact. ELORA BOUTIQUE uses HTML5, CSS3, and JavaScript to develop its frontend. These technologies work together to create the structure, appearance, and interactive functionality of the website. HTML5 is responsible for defining the structure of webpages, CSS3 is used for styling and layout, and JavaScript is used to provide dynamic behavior and user interactions. The combination of these technologies allows the website to provide an attractive and user-friendly interface suitable for an online fashion boutique.

2.4.1 HTML5

HTML5, which stands for HyperText Markup Language 5, is used to create the basic structure of the ELORA BOUTIQUE website. It provides different elements for creating headings, paragraphs, images, navigation menus, product sections, buttons, forms, links, and footer sections. HTML5 also provides semantic elements such as header, navigation, section, article, and footer, which help in organizing webpage content properly. In ELORA BOUTIQUE, HTML5 is used to create the main website structure and different sections such as Home, New Arrivals, Categories, Featured Collection, About Us, Contact, Wishlist, and Cart. HTML5 therefore provides the basic foundation on which the rest of the frontend is developed.

2.4.2 CSS3

CSS3, which stands for Cascading Style Sheets, is used to control the appearance and layout of the ELORA BOUTIQUE website. It is responsible for styling elements such as colors, fonts, spacing, borders, backgrounds, buttons, product cards, navigation menus, and images. CSS3 is also used to create a visually attractive boutique-style design and maintain consistency throughout the website. The ELORA BOUTIQUE design uses soft and elegant colors suitable for a Pakistani fashion store. CSS can also be used to make the website responsive so that its layout can adapt to different screen sizes such as desktops, tablets, and mobile devices.

2.4.3 JavaScript

JavaScript is a programming language used to provide dynamic and interactive functionality to the ELORA BOUTIQUE website. It allows the website to respond to different user actions and perform operations without requiring every action to be handled manually. JavaScript can be used for product filtering, form validation, wishlist functionality, shopping cart interactions, navigation events, dynamic product display, and communication with backend APIs. It helps make the website more interactive and improves the overall user experience. JavaScript works together with HTML and CSS to create a functional and responsive frontend.

2.5 Backend Technologies

The backend is the server-side part of the ELORA BOUTIQUE application. It is responsible for processing requests, implementing application logic, communicating with the database, and returning the required information to the frontend. The project uses ASP.NET Core 8 and C# for backend development. The backend provides the necessary services and APIs required for managing and retrieving website data. It acts as a connection between the frontend interface and the SQL Server database.

2.5.1 ASP.NET Core 8

ASP.NET Core 8 is a modern, open-source, and cross-platform framework developed by Microsoft for building web applications and web APIs. In ELORA BOUTIQUE, ASP.NET Core 8 is used to develop the backend of the application and handle communication between the frontend and the database. It can process requests related to product information, categories, users, cart operations, wishlist operations, and orders. ASP.NET Core also provides the structure required for developing APIs through which the frontend can communicate with the backend. The use of ASP.NET Core 8 provides a structured environment for developing the server-side functionality of the boutique website.

2.5.2 Entity Framework Core

Entity Framework Core is an Object-Relational Mapper used with .NET applications to communicate with relational databases. It allows developers to work with database records through C# objects and models instead of writing every database operation manually. In ELORA BOUTIQUE, Entity Framework Core is used to establish communication between the ASP.NET Core application and Microsoft SQL Server. It can be used to retrieve product information, insert new records, update existing records, and delete records when required. Entity Framework Core makes database operations more organized and provides a convenient way to work with relational data in the ASP.NET Core application.

2.6 Database Technologies

A database is an important part of the ELORA BOUTIQUE system because it is used to store and manage application information. The database stores information that is required by the website, such as product details, categories, customer information, cart information, wishlist information, and order-related data. **Microsoft SQL Server** is used as the relational database management system for the project. The database works together with ASP.NET Core and Entity Framework Core to provide the required data to the website.

2.6.1 Microsoft SQL Server

Microsoft SQL Server is a relational database management system developed by Microsoft. It stores information in tables containing rows and columns and provides SQL commands for managing the stored data. In ELORA BOUTIQUE, SQL Server can be used to store product names, prices, descriptions, categories, images, customer information, cart details, wishlist information, and order details. The relational structure of SQL Server helps keep the information organized and allows relationships to be created between different types of data. SQL Server therefore provides the database foundation required for the backend of the ELORA BOUTIQUE application.

2.6.2 SQL

SQL, or Structured Query Language, is used to communicate with a relational database such as Microsoft SQL Server. SQL provides commands for retrieving, inserting, updating, and deleting information from database tables. In ELORA BOUTIQUE, SQL can be used to manage product, customer, category, and order-related information. For example, a SELECT query can be used to retrieve products from the database, while INSERT can be used to add a new product. UPDATE can modify existing information, and DELETE can remove unwanted records. SQL therefore plays an important role in managing the data used by the application.

CHAPTER 3

REQUIREMENTS AND ANALYSIS

ELORA BOUTIQUE is designed as a web-based Pakistani readymade dress boutique that allows customers to explore and manage fashion products through a single online platform. The website provides an organized way to display dresses, categories, new arrivals, featured collections, product details, wishlist, shopping cart, and other related shopping features. Before development, it is important to identify the requirements of the system and analyze the needs of the intended users. The Requirements and Analysis phase focuses on understanding what the website should provide, who will use the system, how users will interact with it, and what hardware and software are required for development. This analysis helps in designing and implementing the ELORA BOUTIQUE system effectively.

3.1 Problem Definition

In the traditional boutique system, customers generally need to visit the physical store to view available dresses and collect information about products, prices, categories, and designs. Managing a large collection of products manually can also be difficult for boutique owners. Customers may have difficulty finding specific types of dresses when products are not organized according to categories. In addition, customers may not be able to conveniently browse the collection outside the boutique's physical working hours.

Many small boutiques use social media or messaging platforms to display their products. Although these platforms provide a way to communicate with customers, they may not provide a dedicated shopping environment with organized product categories, product details, wishlist functionality, shopping cart functionality, and order-related features. Therefore, there is a need for a dedicated boutique website that provides customers with an organized and convenient way to explore Pakistani ready-made dresses.

3.2 Requirements Specification

ELORA BOUTIQUE is a web-based online boutique system developed to provide customers with an easy and convenient way to browse Pakistani ready-made dresses. The website focuses on providing an attractive user interface along with useful shopping functionalities. The requirements of the ELORA BOUTIQUE system can be categorized into **functional requirements** and **non-functional requirements**.

3.2.1 Functional Requirements

Functional requirements describe the features and operations that the ELORA BOUTIQUE system is expected to provide.

User Registration and Authentication

The system should provide a registration facility through which new customers can create an account by providing the required information. Registered users should be able to log in using their credentials. Authentication helps the system identify users and provide access to features associated with their accounts.

User Profile Management

The system should allow registered users to manage their basic profile information. Users should be able to view and update relevant account details whenever required. This information can be used during shopping and order-related activities.

Product Browsing

The website should allow customers to browse the available Pakistani ready-made dresses. Products should be displayed with relevant information such as product name, image, price, category, and description. The product presentation should be simple and clear so that customers can easily understand the available collection.

Product Categories

The system should organize products into different categories to make browsing easier. Categories may include cotton, silk, rayon, lawn, embroidered dresses, festive wear, formal wear, and other available collections. Customers should be able to select a category and view the products associated with it.

New Arrivals and Featured Collection

The website should provide dedicated sections for new arrivals and featured products. These sections allow customers to quickly identify recently added products and selected products from the boutique collection.

Product Details

The system should provide a detailed view of individual products. The product details page can display the product image, name, price, category, description, available size or other relevant information. This allows customers to examine a product before adding it to their wishlist or shopping cart.

Wishlist Management

The system should allow registered users to add products to a wishlist for future consideration. Users should be able to view their selected wishlist products and remove products when they are no longer interested in them.

Shopping Cart

The shopping cart should allow customers to add selected products before proceeding with the purchase. Users should be able to view the products added to the cart and check relevant information such as product name, quantity, and price.

Checkout

The system should provide a checkout process through which customers can review their selected products and provide the required information for completing an order. The checkout process can be extended in future versions to include online payment gateway integration.

3.2.2 Non-Functional Requirements

Non-functional requirements describe the quality, performance, usability, security, and reliability characteristics of the ELORA BOUTIQUE system.

Usability

The website should provide a simple, attractive, and user-friendly interface. Navigation should be clear so that customers can easily move between Home, New Arrivals, Categories, Featured Collection, About Us, Contact, Wishlist, and Cart sections. The website should be understandable even for users who have limited technical knowledge.

Performance

The website should respond to user actions within a reasonable amount of time. Product information, images, categories, and other pages should load efficiently. The application should avoid unnecessary delays and should provide smooth navigation during normal usage.

Security

The system should protect user account information and other important data from unauthorized access. Login credentials should be handled securely, and access to administrative functionality should be restricted to authorized users. Database operations should also be performed through appropriate backend mechanisms.

Reliability

The website should operate consistently and should process user requests correctly. Product information, user details, cart information, wishlist information, and other stored data should be maintained accurately. The system should minimize errors and prevent unnecessary data loss during normal operation.

3.3 Planning and Scheduling

Efficient planning and scheduling are important for completing the ELORA BOUTIQUE project systematically. The project is divided into different development phases so that each activity can be completed according to its requirements and dependencies. The major activities include project planning, requirement gathering, technology research, system design, frontend development, backend development, database development, testing, and documentation. Proper scheduling helps ensure that .

3.3.1 Project Planning

Project planning is the initial stage of the ELORA BOUTIQUE development process. During this stage, the objectives and scope of the website are identified. The main objective is to develop a web-based Pakistani ready-made dress boutique that provides organized product browsing and shopping-related functionality.

The project scope includes designing the user interface, creating product and category sections, implementing interactive functionality using JavaScript, developing the backend using ASP.NET Core 8, connecting the application with Microsoft SQL Server, and testing the completed system. The required tools and technologies are also identified during planning.

The project is divided into smaller modules such as user management, product management, category management, product browsing, wishlist, shopping cart, checkout, database management, and administration. the development process remains organized and that the major components of the website are completed within the planned project period. Each module is planned according to its complexity and dependency on other modules.

Potential risks such as database connectivity problems, backend errors, incorrect API communication, design issues, and testing delays are considered during project planning. Identifying these risks in advance helps in preparing suitable solutions and reducing their impact on the development process.

3.3.2 Scheduling Tools

Gantt Chart

A Gantt chart is a visual project management tool that represents project activities according to their planned start and completion periods. It helps the development team understand the sequence of activities and identify which tasks can be performed simultaneously.

For the ELORA BOUTIQUE project, the development timeline can be divided into different phases. **Project Planning** is performed during the initial stage to define the project scope and objectives. **Requirement Gathering** is then carried out to identify the functional and non-functional requirements. **Technology Research** focuses on selecting appropriate frontend, backend, and database technologies. **System Design** includes designing the website structure, database, user interface, and system architecture. **Implementation** includes frontend, backend, and database development. **Testing** is performed to identify and correct errors and verify that the system functions according to the requirements. Finally, **Documentation** is completed to prepare the project report and supporting documentation.

PERT Chart

A PERT (Program Evaluation and Review Technique) chart is a project management diagram used to represent the sequence and dependency of different project activities. It helps identify the relationship between tasks and understand the order in which activities should be completed.

For ELORA BOUTIQUE, the PERT chart can begin with project planning and requirement analysis, followed by technology selection and system design. After the design is completed, frontend, backend, and database development can be carried out. These components are then integrated and tested. After successful testing, the final documentation and project completion activities are performed.

3.4 Software and Hardware Requirements

3.4.1 Software Requirements

The ELORA BOUTIQUE website requires several software technologies for its development and execution. The frontend is developed using HTML5, CSS3, and JavaScript, which are responsible for creating the structure, design, and interactive functionality of the website. The backend is developed using ASP.NET Core 8 with C# for implementing application logic and APIs. Entity Framework Core is used to communicate with the database, while Microsoft SQL Server is used for storing and managing application data. A development environment such as Visual Studio or Visual Studio Code can be used for writing and managing the project source code. A modern web browser such as Google Chrome, Microsoft Edge, or Mozilla Firefox can be used for testing and running the website.

3.4.2 Hardware Requirements

The ELORA BOUTIQUE project can be developed using a standard computer or laptop suitable for web development. A processor such as Intel Core i3 or higher or an equivalent AMD processor can be used for basic development, while a higher-performance processor can provide better multitasking. A minimum of 4 GB RAM can support basic development activities, although 8 GB or more is recommended for running the development environment, database server, browser, and other applications simultaneously. Sufficient storage space is required for source code, development tools, database files, images, and project documentation. A standard keyboard, mouse, and display are required for development and testing. Additional devices such as smartphones and tablets can be used to test the responsiveness and compatibility of the website across different screen sizes.

3.5 Preliminary Product Description

ELORA BOUTIQUE is a web-based Pakistani readymade dress boutique developed to provide customers with an organized and convenient online platform for exploring fashion products. The website focuses on presenting Pakistani clothing collections such as lawn suits, embroidered suits, kurtas, casual wear, festive wear,

formal wear, and other ready-made dresses. The system provides a visually appealing interface where customers can browse products according to different categories and collections.

The website includes important sections such as Home, New Arrivals, Categories, Featured Collection, About Us, Contact, Wishlist, and Shopping Cart. Customers can view product images and information and can interact with available shopping features. The product categories help users find specific types of dresses more easily, while the New Arrivals and Featured Collection sections provide quick access to selected products.

The frontend of ELORA BOUTIQUE is developed using HTML5, CSS3, and JavaScript. HTML5 provides the structure of the website, CSS3 provides the visual design and layout, and JavaScript provides interactive functionality. The backend is developed using ASP.NET Core 8 and C#, which handles application logic and communication between the website and database. Microsoft SQL Server is used to store product and other application-related information, while Entity Framework Core is used for database access.

The system is designed so that it can be extended with additional e-commerce functionality in the future. Possible enhancements include online payment integration, order tracking, customer reviews, product recommendations, discount management, and advanced search. The main objective of ELORA BOUTIQUE is to provide a simple and organized digital platform for presenting Pakistani ready-made dresses while creating a convenient shopping experience for customers.

3.6 Conceptual Models

The conceptual models of ELORA BOUTIQUE are used to represent the structure, functionality, data relationships, and workflow of the system before and during implementation. These models help in understanding how users interact with the website, how different system components are connected, and how information is stored in the database.

3.6.1 Entity Relationship (ER) Diagram

The Entity Relationship Diagram represents the database structure of the ELORA BOUTIQUE system. It shows the main entities, their attributes, and the relationships between different entities. The ER diagram helps in designing the database before implementation and ensures that important information is organized properly.

3.6.2 Use Case Diagram

The Use Case Diagram represents the interaction between the users and the ELORA BOUTIQUE system. It shows the major functions that different users can perform within the website. The diagram helps identify the system's functional requirements and provides a visual representation of how users interact with different features.

The main actors in the ELORA BOUTIQUE system are the **Customer/User** and the **Administrator**. The customer interacts with the website to register or log in, browse products, view product details, search or filter products, add products to the wishlist, add products to the shopping cart, and proceed through the checkout process. The administrator is responsible for managing products, categories, and other relevant boutique information.

3.6.4 Activity Diagram

The Activity Diagram illustrates the sequence of activities performed by a customer while interacting with the ELORA BOUTIQUE website. It helps describe the workflow of the system from the user's initial visit to product selection and shopping-related activities.

CHAPTER 4

SYSTEM DESIGN

4.1 Introduction

ELORA BOUTIQUE is a web-based Pakistani readymade dress boutique designed to provide customers with a simple, attractive, and organized online shopping experience. The system allows users to browse different collections of Pakistani dresses, view product details, explore categories, and use shopping-related features such as wishlist and cart. The website is designed to present products in a visually appealing manner while keeping navigation simple and convenient for customers.

The system uses a modular design approach in which different functionalities are divided into separate modules. The frontend is developed using **HTML5, CSS3, and JavaScript**, while the backend is developed using **ASP.NET Core 8 and C#**. **Entity Framework Core** is used for database communication, and **Microsoft SQL Server** is used to store and manage application data. This structure provides clear separation between the user interface, application logic, and database.

The system design of ELORA BOUTIQUE focuses on usability, organized data management, security, maintainability, and future scalability. The design considers the requirements of both customers and administrators. Customers can browse and interact with products, while administrators can manage product-related information. The modular structure also allows additional features to be added in future versions.

4.2 Basic Modules

The basic modules of ELORA BOUTIQUE are the core functional units of the website. Each module is responsible for a specific part of the system, such as user management, product management, category management, wishlist, shopping cart, checkout, and administration. Dividing the system into modules makes the application easier to develop, test, maintain, and enhance. The major modules of the ELORA BOUTIQUE system are described below.

4.2.1 User Management Module

The User Management Module manages user-related operations such as registration, login, and profile information. New customers can create an account by providing the required details, while registered customers can log in to access account-related features. The module helps maintain customer information and provides the foundation for personalized shopping activities such as wishlist and cart management. User authentication also helps restrict account-specific information from unauthorized users.

4.2.2 Product Management Module

The Product Management Module is responsible for managing the dresses available on the ELORA BOUTIQUE website. Product information can include the product name, price, description, image, category, and availability. The administrator can add new products, update existing product information, and remove products when necessary. This module ensures that the collection displayed on the website remains organized and updated.

4.2.3 Category Management Module

The Category Management Module organizes products according to their respective categories. Pakistani ready-made dresses can be grouped into categories such as cotton, silk, rayon, lawn, embroidered, festive, formal, and other available collections. This module makes it easier for customers to find products according to their interests. The administrator can manage categories and associate products with the appropriate category.

4.3 Data Design

The data design of ELORA BOUTIQUE is structured to store and manage information related to users, products, categories, wishlists, carts, and orders. The system follows a relational database approach using **Microsoft SQL Server**. Each major type of information is maintained in a separate table, and relationships are established between tables using primary keys and foreign keys.

For example, a category can contain multiple products, while a user can have multiple wishlist items, cart items, and orders. The database design helps prevent unnecessary duplication of information and maintains relationships between different entities. **Entity Framework Core** is used by the ASP.NET Core backend to communicate with the database. The data design also allows the system to be extended in the future with features such as reviews, payments, discounts, and order tracking.

4.3.1 Schema Design

The database of ELORA BOUTIQUE consists of several tables that store the information required by the system. The **Users Table** stores customer account information such as UserID, Name, Email, Password, and other required profile details. The **Categories Table** stores category information such as CategoryID and CategoryName. The **Products Table** stores information about dresses, including ProductID, ProductName, CategoryID, Price, Description, Image, and Stock or availability information.

The **Wishlist Table** stores information about products saved by users for future consideration. It can contain WishlistID, UserID, ProductID, and other required fields. The **Cart Table** stores products selected by users for purchase and can contain CartID, UserID, ProductID, Quantity, and Price. The **Orders Table** stores information about customer orders, while the **OrderDetails Table** stores the individual products associated with each order. These tables are connected using primary and foreign keys to maintain relationships between users, products, categories, carts, wishlists, and orders.

CHAPTER 5

IMPLEMENTATION AND TESTING

5.1 Implementation Approaches

The implementation phase is an important stage of the Software Development Life Cycle (SDLC), where the system design is converted into a working application. For the **ELORA BOUTIQUE | Pakistani Readymade Dresses** website, the implementation process focused on developing a user-friendly, responsive, and reliable online boutique platform. The website was developed using **HTML5, CSS3, and JavaScript** for the frontend, while **ASP.NET Core 8 and C#** were used for backend development. **Entity Framework Core** was used for database communication and **Microsoft SQL Server** was used to store and manage application data.

The implementation followed a modular approach so that different parts of the website could be developed, tested, and maintained separately. The main focus was on product browsing, category management, user interaction, wishlist, shopping cart, and administrative product management.

1. Modular and Layered Approach

To make the application easier to maintain and debug, the ELORA BOUTIQUE website was organized into different logical layers. The separation of frontend, backend, and database responsibilities helps reduce complexity and makes future modifications easier.

Presentation Layer (HTML5, CSS3 and JavaScript): The presentation layer provides the visual interface of the website. HTML5 was used to create the structure of pages such as Home, Categories, Product Details, About Us, Contact, Wishlist, and Cart. CSS3 was used to create the boutique-style design, layout, colors, typography, and responsive appearance. JavaScript was used to provide interactive functionality such as product selection, category filtering, wishlist operations, cart operations, and form interactions.

Application and Service Layer (ASP.NET Core 8): The backend layer contains the main application logic. ASP.NET Core Web API was used to process requests received from the frontend and perform operations related to products, users, categories, wishlist, cart, and orders.

Data Access Layer (Entity Framework Core): Entity Framework Core provides communication between the ASP.NET Core application and SQL Server database. It allows the application to perform operations such as inserting, retrieving, updating, and deleting product and user information.

Database Layer (Microsoft SQL Server): SQL Server stores the permanent application data. Tables can include Users, Categories, Products, Wishlist, Cart, Orders, and OrderDetails. Relationships between these tables help maintain organized and consistent data.

2. Iterative Development Approach

The development of the ELORA BOUTIQUE website was performed in an iterative manner. The project was divided into smaller modules so that each important feature could be developed and tested separately. Initially, the basic website structure and navigation were developed. After that, product and category sections were implemented, followed by user-related features and shopping functionality.

During development, the website interface was tested repeatedly to identify layout issues, incorrect navigation, form validation problems, and database-related errors. Necessary modifications were made after testing each module. This approach helped in improving the usability and reliability of the website.

3. Environment and Tool Selection

The frontend of the website was developed using **HTML5, CSS3, and JavaScript**. HTML5 provides the basic page structure, CSS3 controls the visual appearance and responsive layout, and JavaScript provides client-side interaction and dynamic functionality.

5.2 Coding Details and Code Efficiency

This section describes the important coding practices used during the development of the ELORA BOUTIQUE website. Instead of including the complete source code, selected code segments related to the major modules can be presented. The coding structure focuses on maintaining readable, reusable, and efficient code.

The frontend code is divided into separate HTML, CSS, and JavaScript files wherever appropriate. This separation makes the website easier to modify. The backend follows a structured approach in which API controllers handle requests, application logic processes the requests, and Entity Framework Core communicates with the SQL Server database.

5.2.1 Code Efficiency

Code efficiency in ELORA BOUTIQUE focuses on reducing unnecessary processing, maintaining organized code, and providing quick responses to user actions. The frontend uses JavaScript only where required for interactive operations, while the backend processes database-related operations through ASP.NET Core APIs.

Asynchronous programming using `async` and `await` can be used for database operations so that the application does not unnecessarily block while waiting for a database response. Entity Framework Core can also be used with appropriate queries to retrieve only the required information.

Database tables should contain appropriate primary keys and relationships so that product, user, cart, wishlist, and order information can be retrieved efficiently. Frequently searched fields can also be indexed in SQL Server when required.

5.2.2 Code Snippets

1. Backend: Product Retrieval Using ASP.NET Core and Entity Framework Core

The following example demonstrates how product information can be retrieved asynchronously from the database.

```
var builder = WebApplication.CreateBuilder(args);

builder.Services.AddControllers();

builder.Services.AddCors(options =>
{
    options.AddDefaultPolicy(policy =>
```

```

        policy.AllowAnyOrigin()
            .AllowAnyMethod()
            .AllowAnyHeader();
    });
});

var app = express = builder.Build();

app.UseCors();

// Serve frontend images
app.UseStaticFiles();

app.MapControllers();

app.Run();

```

2. Frontend: Product Filtering Using JavaScript

JavaScript can be used to filter products according to the category selected by the user. async function loadFeaturedProducts() {

```

    var grid =
        document.getElementById('featuredGrid');

    if (grid == null) {
        return;
    }

    try {

        var response =
            await fetch(API_URL + '/products');

        var products =

```

```
    await response.json();

allProducts =
    products;

grid.innerHTML = "";

var count = 0;

for (var i = 0; i < products.length; i++) {

    var product =
        products[i];

    if (product.section !== 'New Arrival') {
        continue;
    }

    if (count >= 4) {
        break;
    }

    var card =
        document.createElement('div');

    card.className =
        'product-card';

    var imagePath =
        new URL(
            product.imageUrl,
            window.location.href
        ).href;

    card.innerHTML =
```

```
'<a href="product.html?id=' +  
product.productId +  
'">' +
```

```
'<div class="img-wrap">' +
```

```
'<img src='" +  
imagePath +  
'" alt='" +  
product.name +  
'">' +
```

```
'</div>' +
```

```
'</a>' +
```

```
'<p class="card-name">' +
```

```
'<a href="product.html?id=' +  
product.productId +  
'">' +
```

```
product.name +
```

```
'</a>' +
```

```
'</p>' +
```

```
'<span class="card-price">₹' +  
product.price.toFixed(2) +  
'</span>' +
```

```
'<button class="card-add-btn" onclick="addToCart(' +  
product.productId +
```

```

        ')">' +

        'ADD TO CART' +

        '</button>';

    grid.appendChild(card);

    count++;
}

} catch (error) {

    grid.innerHTML =
        '<p style="color:#d77f88;">' +
        'Could not load new arrivals.' +
        '</p>';
}
}

```

5.3 Testing Approach

Testing was performed to verify that the ELORA BOUTIQUE website functions according to the specified requirements.

Different modules were checked individually and then tested together to identify functional, interface, database, and validation errors.

Testing focused on user registration and login, product display, category filtering, product details, wishlist, shopping cart, checkout-related operations, admin product management, API communication, and database connectivity.

5.3.1 Unit Testing

Unit testing involves testing individual functions or components separately. In ELORA BOUTIQUE, individual JavaScript functions and backend methods were tested to ensure that they produced the expected results.

For example, product filtering was tested with different categories to confirm that only the relevant products were displayed.

Backend API methods were also tested to verify that product information could be retrieved correctly from the database.

5.3.2 Integration Testing

Integration testing was performed to verify communication between different parts of the application. The frontend, ASP.NET Core backend, Entity Framework Core, and SQL Server database were tested together.

For example, when product information is requested from the frontend, the request is sent to the ASP.NET Core API. The backend communicates with SQL Server through Entity Framework Core and returns the product information to the frontend. This complete flow was tested to ensure that the different layers work correctly together.

User-related operations, product management, wishlist operations, cart operations, and database updates were also checked as integrated processes.

5.3.3 User Acceptance Testing

User acceptance testing was performed to check whether the website was easy to understand and use from a customer's perspective.

The main focus was on navigation, product visibility, category selection, product details, wishlist and cart interactions, and the overall appearance of the boutique website.

The website interface was checked on different screen sizes to ensure that the layout remained usable. Forms were also checked to identify missing or invalid input and provide appropriate validation messages.

CHAPTER 6

RESULTS AND DISCUSSION

6.1 Test Reports

This section describes the results obtained after testing the **ELORA BOUTIQUE | Pakistani Readymade Dresses** website. The testing process was performed to verify the functionality, usability, database connectivity, and reliability of the different modules of the website. The major areas tested included user interaction, product browsing, category filtering, wishlist, shopping cart, product management, API communication, and database operations.

6.1.1 Unit Testing Results

Each important frontend function and backend operation was tested separately to verify that it performed the expected task. The product display and category filtering functions were tested with different product categories to ensure that the correct products were displayed. Form validation was also checked to ensure that required fields were properly validated.

The backend API methods were tested to verify that product information could be retrieved, added, updated, and deleted correctly. Database operations performed

through Entity Framework Core were also checked to confirm that the expected records were stored and retrieved from SQL Server.

6.1.2 Integration Testing Results

Integration testing was performed to verify communication between the frontend, ASP.NET Core backend, Entity Framework Core, and SQL Server database. Product information requested from the website was successfully processed through the backend API and retrieved from the database.

Operations such as adding products, updating product information, retrieving categories, and managing user-related data were tested across the complete application flow. The testing helped verify that data was transferred correctly between the different layers of the system.

6.1.3 User Acceptance Testing Results

User acceptance testing was performed to understand how easily users could navigate and interact with the ELORA BOUTIQUE website. The users were asked to browse products, select categories, view product details, and use available wishlist and cart functions.

The feedback mainly focused on the appearance of the website, ease of navigation, readability of product information, and responsiveness on different screen sizes. Based on the observations, improvements were made to the layout, product cards, navigation, and responsive design.

6.1.4 Objectives of Testing

The main objectives of testing the ELORA BOUTIQUE website were to ensure that the website displays product information correctly, allows users to navigate between different sections, and provides proper category-based product browsing. Testing was also performed to verify that user input is properly validated and that product, wishlist, cart, and other application data can be processed correctly.

Another objective was to verify communication between the frontend and ASP.NET Core backend and ensure that the backend can communicate correctly

with the SQL Server database through Entity Framework Core. The testing also aimed to identify interface and functional issues and improve the overall reliability and usability of the website.

Test Results

The testing process confirmed that the major tested functions of the website performed according to their expected requirements. Product information was displayed correctly, category filtering worked as expected, and database operations were successfully tested. Validation was also checked for user input and forms.

6.2 User Documentation

This section provides a basic user guide for the **ELORA BOUTIQUE | Pakistani Readymade Dresses** website. It explains how users can navigate through the website and use its major features. The documentation is written in a simple step-by-step manner so that first-time users can easily understand the working of the website.

Home Page

The Home Page is the main entry point of the ELORA BOUTIQUE website. It introduces users to the boutique and displays selected Pakistani ready-made dresses. The page contains the main navigation menu through which users can access different sections of the website.

Users can view featured products, new arrivals, categories, and other important sections directly from the Home Page. Product images, names, prices, and relevant information are displayed in an organized manner.

[SHOP BY CATEGORY](#)

Login Page

The Login Page allows registered users to access their account.

1. Navigate to the **Login** section of the website.
2. Enter the registered email address or username.
3. Enter the account password.
4. Submit the login form.
5. After successful validation, the user can access the available account-related features.

If incorrect or incomplete information is entered, the system displays an appropriate validation message.

Category Page

The Category section helps users browse dresses according to their fabric or product category. Categories may include **Cotton, Silk, Rayon, Organza, Georgette**, and other available categories.

Users can select a category and view the products associated with that category. This reduces the time required to find a particular type of dress.

Shopping Cart Page

The Shopping Cart stores the products selected by the user for purchase. Users can review their selected products before proceeding with the checkout process.

The cart can display the product name, quantity, price, and total amount. Users can modify or remove items according to the available functionality.

1. Select a product.
2. Click **Add to Cart**.
3. Open the Cart section.

4. Review the selected products.
5. Modify or remove products if required.
6. Continue to checkout.

6.3 Discussion of Results

The implementation and testing of the ELORA BOUTIQUE website demonstrated that the proposed system can provide a structured digital platform for showcasing and managing Pakistani ready-made dresses. The separation of frontend, backend, and database components helped organize the application and simplify the management of different functions.

The frontend provides an interactive and visually consistent boutique interface, while ASP.NET Core handles application requests and business operations. Entity

Framework Core provides communication with SQL Server, allowing product and other application data to be stored and retrieved systematically.

The testing results also helped identify areas where the website could be improved. Responsive design, form validation, navigation, database communication, and product management were reviewed during testing. The modifications made after testing improved the overall usability and reliability of the system.

The separation of frontend, backend, and database components helped organize the application and simplify the management of different functions.

The frontend provides an interactive and visually consistent boutique interface, while ASP.NET Core handles application requests and business operations. Entity Framework Core provides communication with SQL Server, allowing product and other application data to be stored and retrieved systematically.

CHAPTER 7

CONCLUSIONS

7.1 Conclusion

The **ELORA BOUTIQUE Pakistani Readymade Dresses** project represents an effort to develop a simple, user-friendly, and organized online platform for

showcasing Pakistani ready-made dresses. The website combines a modern frontend interface with a structured backend and database system to provide users with convenient access to product collections and shopping-related features.

The frontend of the system is developed using **HTML5, CSS3, and JavaScript**, providing the structure, styling, responsiveness, and interactive features of the website. The backend is developed using **ASP.NET Core 8 and C#**, while **Entity Framework Core** is used for communication between the application and **Microsoft SQL Server**. This architecture provides a clear separation between the user interface, application logic, and data storage.

7.2 Limitations of the System

Although ELORA BOUTIQUE provides the basic functionality required for an online boutique website, certain limitations remain and can be addressed in future versions.

Limited Payment Integration: The current system may not include a complete online payment gateway. Actual payment processing would require integration with a suitable secure payment service.

Product Information Dependency: The quality and accuracy of product information depend on the data entered by the administrator. Incorrect product names, prices, descriptions, or images may affect the user experience.

Limited Personalization: The current system does not provide advanced personalized recommendations based on individual customer browsing or purchasing behavior.

Internet Dependency: Since the website communicates with the backend and database through the web application, an active internet connection is generally required when the system is deployed online.

Limited Advanced Search: Basic category-based browsing may be available, while advanced search options such as filtering by price, size, color, fabric, and occasion can be added in future versions.

Limited Order Tracking: Advanced order tracking and delivery-status functionality may require additional backend services and integration with delivery or logistics systems.

7.3 Future Scope of the Project

The ELORA BOUTIQUE website can be further enhanced by introducing additional features that can improve the shopping experience and provide more functionality for boutique management. The following features can be considered for future development.

Online Payment Integration: A secure payment gateway can be integrated to allow customers to complete purchases through online payment methods such as cards, UPI, and other supported options.

Advanced Product Search and Filters: Search and filtering features can be added based on product name, price, fabric, size, color, occasion, and category. This would help users find suitable products more quickly.

Size and Color Selection: Product pages can be enhanced by allowing customers to select available dress sizes and colors before adding a product to the cart.

Product Reviews and Ratings: Customers can be allowed to submit reviews and ratings for purchased products. This can provide additional product information for other users.

Order Tracking: An order tracking module can be developed to allow customers to view order status such as order placed, confirmed, shipped, and delivered.

Discount and Coupon Management: The administrator can be provided with functionality to create discount codes, seasonal offers, and promotional campaigns.

Personalized Recommendations: Future versions can analyze customer preferences and browsing or purchase history to display relevant products.

Mobile Application: A dedicated mobile application can be developed for Android and iOS platforms to provide customers with easier access to the boutique.

Multilingual Support: The website can be extended to support additional languages, making the platform more accessible to customers who prefer languages other than English.

Cloud Deployment: The application can be deployed on a cloud platform to make it accessible online and provide better scalability, backup, and availability.

Admin Analytics Dashboard: A more advanced administration dashboard can be developed to display information such as sales, popular products, customer activity, and order statistics.
